

Unit 11 Submission File: Network Security Homework

Part 1: Review Questions

Security Control Types

The concept of defense in depth can be broken down into three different security control types. Identify the security control type of each set of defense tactics.

1. Walls, bollards, fences, guard dogs, cameras, and lighting are what type of security control?

Answer: Physical

2. Security awareness programs, BYOD policies, and ethical hiring practices are what type of security control?

Answer: Administrative

3. Encryption, biometric fingerprint readers, firewalls, endpoint security, and intrusion detection systems are what type of security control?

Answer: Technical

Intrusion Detection and Attack indicators

1. What's the difference between an IDS and an IPS?

Answer: IDS is a monitoring, and IPS is control system that takes action on packets being delivered

2. What's the difference between an Indicator of Attack and an Indicator of Compromise?

Answer: Proactive approach to intrusion attempts vs reactive approach to success intrusion.

The Cyber Kill Chain

Name each of the seven stages for the Cyber Kill chain and provide a brief example of each.

1. **Stage 1: Reconnaissance** Adversary identifies and gathers information about the target and begins formulating a method of attack. Defenders are unaware but have day to day security measures in place that adversary studies.
2. **Stage 2: Weaponization** The adversary is setting up the back door and the exploit by re-engineering malware into software. Defenders are relying on Intrusion systems for detection
3. **Stage 3: Delivery** Adversary transmits and delivers the weaponized exploit to the victims targeted environment. This is can be done by means of emails, website links, and removable media. Defenders at this stage are still relying on detection
4. **Stage 4: Exploitation** The adversary software is being executed and is utilizing the vulnerability to execute code for manipulation of victim's system.
5. **Stage 5: Installation**
Installing of the malicious code to maintain persistence.
6. **Stage 6: Command and Control** Establish C2 channel to send instruction to compromised hosts system to perform actions

7. **Stage 7: Actions on Objectives** Adversary successful in their endeavor on the users system. Defenders should detect this stage quickly and have tools to collect forensic evidence. Learn and adapt policies for future incidents to prevent.

Snort Rule Analysis

Use the Snort rule to answer the following questions:

Snort Rule #1

```
alert tcp $EXTERNAL_NET any -> $HOME_NET 5800:5820 (msg:"ET SCAN Potential VNC Scan 5800-5820"; flags:S,12; threshold: type both, track by_src, count 5, seconds 60; reference:url,doc.emergingthreats.net/2002910; classtype:attempted-recon; sid:2002910; rev:5; metadata:created_at 2010_07_30, updated_at 2010_07_30;)
```

1. Break down the Sort Rule header and explain what is happening.

Answer: Alerts users of ANY inbound TCP traffic from ports 5800 and 5820

2. What stage of the Cyber Kill Chain does this alert violate?

Answer: Recon

3. What kind of attack is indicated?

Answer: Potential VNC Scan

Snort Rule #2

```
alert tcp $EXTERNAL_NET $HTTP_PORTS -> $HOME_NET any (msg:"ET POLICY PE EXE or DLL Windows file download HTTP"; flow:established,to_client; flowbits:isnotset,ET.http.binary; flowbits:isnotset,ET.INFO.WindowsUpdate; file_data; content:"MZ"; within:2; byte_jump:4,58,relative,little; content:"PE|00 00|"; distance:-64; within:4; flowbits:set,ET.http.binary; metadata: former_category POLICY; reference:url,doc.emergingthreats.net/bin/view/Main/2018959; classtype:policy-violation; sid:2018959; rev:4; metadata:created_at 2014_08_19, updated_at 2017_02_01;)
```

1. Break down the Sort Rule header and explain what is happening.

Answer: Alerts for inbound TCP traffic on Port 80(HTTP)

2. What layer of the Defense in Depth model does this alert violate?

Answer: Policies, awareness and procedures

3. What kind of attack is indicated?

Answer: Policy PE EXE or DLL file download

Snort Rule #3

- Your turn! Write a Snort rule that alerts when traffic is detected inbound on port 4444 to the local network on any port. Be sure to include the `msg` in the Rule Option.

Answer: alert tcp *EXTERNAL_N*ET4444- >HOME_NET any (msg: "ET Possible Trojan or Worse")

Part 2: "Drop Zone" Lab

Log into the Azure `firewalld` machine

Log in using the following credentials:

- Username: `sysadmin`
- Password: `cybersecurity`

Uninstall `ufw`

Before getting started, you should verify that you do not have any instances of `ufw` running. This will avoid conflicts with your `firewalld` service. This also ensures that `firewalld` will be your default firewall.

- Run the command that removes any running instance of `ufw`.

```
$ <sudo apt -y remove ufw>
```

Enable and start `firewalld`

By default, these service should be running. If not, then run the following commands:

- Run the commands that enable and start `firewalld` upon boots and reboots.

```
$ <sudo systemctl enable firewalld>  
$ <sudo systemctl start firewalld>
```

Note: This will ensure that `firewalld` remains active after each reboot.

Confirm that the service is running.

- Run the command that checks whether or not the `firewalld` service is up and running.

```
$ <systemctl status firewalld or firewall-cmd --state>
```

List all firewall rules currently configured.

Next, lists all currently configured firewall rules. This will give you a good idea of what's currently configured and save you time in the long run by not doing double work.

- Run the command that lists all currently configured firewall rules:

```
$ <sudo firewall-cmd --list-all>
```

- Take note of what Zones and settings are configured. You may need to remove unneeded services and settings.

List all supported service types that can be enabled.

- Run the command that lists all currently supported services to see if the service you need is available

```
$ <sudo firewall-cmd --get-services>
```

- We can see that the `Home` and `Drop` Zones are created by default.

Zone Views

- Run the command that lists all currently configured zones.

```
$ <sudo firewall-cmd --list-all-zones>
```

- We can see that the `Public` and `Drop` Zones are created by default. Therefore, we will need to create Zones for `Web`, `Sales`, and `Mail`.

Create Zones for `Web`, `Sales` and `Mail`.

- Run the commands that creates Web, Sales and Mail zones.

```
$ <sudo firewall-cmd --permanent --new-zone=web>
$ <sudo firewall-cmd --permanent --new-zone=sales>
$ <sudo firewall-cmd --permanent --new-zone=mail>
```

Set the zones to their designated interfaces:

- Run the command that sets your `eth0` interface to your zones.

```
$ <sudo firewall-cmd --zone=public --change-interface=eth0>
$ <sudo firewall-cmd --zone=web --change-interface=eth0>
$ <sudo firewall-cmd --zone=sales --change-interface=eth0>
$ <sudo firewall-cmd --zone=mail --change-interface=eth0>
```

Add services to the active zones:

- Run the commands that add services to the **public** zone, the **web** zone, the **sales** zone, and the **mail** zone.
- Public:

```
$ <sudo firewall-cmd --zone=public --add-service=smtp>
$ <sudo firewall-cmd --zone=public --add-service=http>
$ <sudo firewall-cmd --zone=public --add-service=https>
$ <sudo firewall-cmd --zone=public --add-service=pop3>
```

- Web:

```
$ <sudo firewall-cmd --zone=web --add-service=http>
```

- Sales

```
$ <sudo firewall-cmd --zone=sales --add-service=https>
```

- Mail

```
$ <sudo firewall-cmd --zone=mail --add-service=smtp>
$ <sudo firewall-cmd --zone=mail --add-service=pop3>
```

- What is the status of `http`, `https`, `smtp` and `pop3`?

Add your adversaries to the Drop Zone.

- Run the command that will add all current and any future blacklisted IPs to the Drop Zone.

```
$ <sudo firewall-cmd --zone=drop --add-source=10.208.56.23>
$ <sudo firewall-cmd --zone=drop --add-source=135.95.103.76>
$ <sudo firewall-cmd --zone=drop --add-source=76.34.169.118>
```

Make rules permanent then reload them:

It's good practice to ensure that your `firewalld` installation remains nailed up and retains its services across reboots. This ensure that the network remains secured after unplanned outages such as power failures.

- Run the command that reloads the `firewalld` configurations and writes it to memory

```
$ <sudo firewall-cmd --reload>
```

View active Zones

Now, we'll want to provide truncated listings of all currently **active** zones. This a good time to verify your zone settings.

- Run the command that displays all zone services.

```
$ <sudo firewall-cmd --get-active-zones>
```

Block an IP address

- Use a rich-rule that blocks the IP address `138.138.0.3`.

```
$ <sudo firewall-cmd --zone=public --add-rich-rule='rule family="ipv4"source
address="138.138.0.3" reject'>
```

Block Ping/ICMP Requests

Harden your network against `ping` scans by blocking `icmp ehco` replies.

- Run the command that blocks `pings` and `icmp` requests in your `public` zone.

```
$ <sudo firewall-cmd --zone=public --add-icmp-block=echo-reply --add-icmp-block=echo-request>
```

Rule Check

Now that you've set up your brand new `firewalld` installation, it's time to verify that all of the settings have taken effect.

- Run the command that lists all of the rule settings. Do one command at a time for each zone.

```
$ <sudo firewall-cmd --zone=public --list-all>
$ <sudo firewall-cmd --zone=sales --list-all>
$ <sudo firewall-cmd --zone=mail --list-all>
$ <sudo firewall-cmd --zone=web --list-all>
$ <sudo firewall-cmd --permanent --zone=drop --list-all>
```

- Are all of our rules in place? If not, then go back and make the necessary modifications before checking again.

Congratulations! You have successfully configured and deployed a fully comprehensive `firewalld` installation.

Part 3: IDS, IPS, DiD and Firewalls

Now, we will work on another lab. Before you start, complete the following review questions.

IDS vs. IPS Systems

1. Name and define two ways an IDS connects to a network.

Answer 1: NIDS identifies intrusion by examining network traffic and monitor multiple hosts. NIDS gain access via connection to a network hub/switch. Both Hardware and Software

Answer 2: HIDS agent on a host that identifies intrusion by analysis of system calls, logs, modifications, and other host activities and state. Connects via software.

2. Describe how an IPS connects to a network.

Answer: Physically connected. Placed in-line, actively analyzing and taking automated actions on all traffic flows that enter the network.

3. What type of IDS compares patterns of traffic to predefined signatures and is unable to detect Zero-Day attacks?

Answer: Signature Based IDS.

4. Which type of IDS is beneficial for detecting all suspicious traffic that deviates from the well-known baseline and is excellent at detecting when an attacker probes or sweeps a network?

Answer: Anomaly-Based IDS

Defense in Depth

1. For each of the following scenarios, provide the layer of Defense in Depth that applies:

1. A criminal hacker tailgates an employee through an exterior door into a secured facility, explaining that they forgot their badge at home.

Answer: Physical

2. A zero-day goes undetected by antivirus software.

Answer: Application

3. A criminal successfully gains access to HR's database.

Answer: Data

4. A criminal hacker exploits a vulnerability within an operating system.

Answer: Host

5. A hacktivist organization successfully performs a DDoS attack, taking down a government website.

Answer: Network

6. Data is classified at the wrong classification level.

Answer: Policy, procedure and awareness

7. A state sponsored hacker group successfully firewalked an organization to produce a list of active services on an email server.

Answer: Perimeter

2. Name one method of protecting data-at-rest from being readable on hard drive.

Answer: Encryption

3. Name one method to protect data-in-transit.

Answer: VPN, Spoofers

4. What technology could provide law enforcement with the ability to track and recover a stolen laptop.

Answer: Trackers

5. How could you prevent an attacker from booting a stolen laptop using an external hard drive?

Answer: Firewall encrypted password

Firewall Architectures and Methodologies

1. Which type of firewall verifies the three-way TCP handshake? TCP handshake checks are designed to ensure that session packets are from legitimate sources.

Answer: Circuit-level Firewalls

2. Which type of firewall considers the connection as a whole? Meaning, instead of looking at only individual packets, these firewalls look at whole streams of packets at one time.

Answer: Stateful Firewall

3. Which type of firewall intercepts all traffic prior to being forwarded to its final destination. In a sense, these firewalls act on behalf of the recipient by ensuring the traffic is safe prior to forwarding it?

Answer: Application or Proxy Firewall

4. Which type of firewall examines data within a packet as it progresses through a network interface by examining source and destination IP address, port number, and packet type- all without opening the packet to inspect its contents?

Answer: Packet Filtering Firewall

5. Which type of firewall filters based solely on source and destination MAC address?

Answer: MAC layer firewall

Bonus Lab: "Green Eggs & SPAM"

In this activity, you will target spam, uncover its whereabouts, and attempt to discover the intent of the attacker.

- You will assume the role of a Jr. Security administrator working for the Department of Technology for the State of California.
- As a junior administrator, your primary role is to perform the initial triage of alert data: the initial investigation and analysis followed by an escalation of high priority alerts to senior incident handlers for further review.
- You will work as part of a Computer and Incident Response Team (CIRT), responsible for compiling **Threat Intelligence** as part of your incident report.

Threat Intelligence Card

Note: Log into the Security Onion VM and use the following **Indicator of Attack** to complete this portion of the homework.

Locate the following Indicator of Attack in Sguil based off of the following:

- **Source IP/Port:** 188.124.9.56:80
- **Destination Address/Port:** 192.168.3.35:1035
- **Event Message:** ET TROJAN JS/Nemucod.M.gen downloading EXE payload

Answer the following:

1. What was the indicator of an attack?
 - Hint: What do the details of the reveal?

Answer:

2. What was the adversarial motivation (purpose of attack)?

Answer:

3. Describe observations and indicators that may be related to the perpetrators of the intrusion. Categorize your insights according to the appropriate stage of the cyber kill chain, as structured in the following table.

TTP	Example	Findings
Reconnaissance	How did they attacker locate the victim?	
Weaponization	What was it that was downloaded?	
Delivery	How was it downloaded?	
Exploitation	What does the exploit do?	
Installation	How is the exploit installed?	
Command & Control (C2)	How does the attacker gain control of the remote machine?	
Actions on Objectives	What does the software that the attacker sent do to complete it's tasks?	

Answer :

4. What are your recommended mitigation strategies?

Answer :

5. List your third-party references.

Answer:
